

Cognivara

ACADEMY · BUILD · LEARN · ENGINEER

2026 EDITION · FOUNDING BATCH

Master DevOps. Build the Future.

A live, mentor-led program for engineers who want to provision, containerize, automate and monitor real cloud-native systems — not just watch tutorials.

16 Weeks

DURATION

Live Online

FORMAT

8–10 PM IST

TIMING

20 Max

COHORT SIZE

₹49,999

ONE-TIME FEE

ABOUT · THE PROGRAM

Learn technology the way it's **actually built**.

Cognivara Academy is a live, mentor-led learning academy focused on Cloud, DevOps, Data Science and Generative AI. We believe engineers learn best by building, breaking, debugging and shipping — not by watching a syllabus go by.

THE PROMISE

Stop clicking through cloud consoles. Start shipping infrastructure.

You'll learn by building: provisioned cloud infrastructure, a working CI/CD pipeline, a Kubernetes deployment, and the operational judgment to keep systems running and observable.

Provision

Infrastructure as Code with Terraform and Ansible.

Containerize

Docker and Kubernetes at real cluster scale.

Automate

CI/CD pipelines with GitHub Actions and Jenkins.

Observe

Monitoring and alerting with Prometheus and Grafana.

Built around a simple learning cycle

Live instructor-led

Interactive online sessions, not prerecorded lectures.

Session recordings

Every live session is recorded for enrolled learners.

1:1 doubt support

Dedicated time to clear technical blockers.

Project reviews

Direct feedback on your implementation.

Career support

Resume, GitHub, mock interviews, job-search strategy.

Small cohorts

Capped at 20 engineers for real mentor attention.

Current curriculum

Tools and workflows reviewed as the industry changes.

Portfolio-ready

A capstone you can show in interviews and on GitHub.

HOW LEARNING WORKS

A loop that repeats through every module

1

Learn

Live session with your instructor

2

Practice

Guided hands-on labs

3

Build

Apply it in a real project

4

Review

Mentor feedback on your work

5

Improve

Refine based on feedback

6

Prepare

Interview-ready explanation

Built for engineers ready to own the infrastructure

Prior Linux or cloud experience helps — but it isn't required.

DESIGNED FOR

- IT professionals and system administrators moving into DevOps
- Developers who want to own deployment and infrastructure
- Cloud engineers formalizing hands-on AWS/Azure skills
- Students and professionals with an IT or CS background

NOT THE RIGHT FIT FOR

- Absolute beginners with no computer fundamentals
- Learners who want to avoid the command line
- People looking for a passive, video-only format
- Anyone expecting a guaranteed job outcome

PREREQUISITES

- Basic computer literacy and comfort learning new tools
- Basic networking concepts are helpful, not mandatory
- A laptop with a reliable internet connection

Six phases. One production-grade system.

Each phase builds on the last. You provision, containerize and automate real components incrementally — by week 16 they come together into one deployed, monitored, cloud-native system.

1

WEEKS 1–3

Linux, Bash & Git Foundations

Command-line mastery, shell scripting, networking basics and version control.

2

WEEKS 4–6

Cloud Platforms: AWS & Azure

Core compute, storage, identity and networking services on both clouds.

3

WEEKS 7–9

Containers & Orchestration

Docker fundamentals, Kubernetes clusters and breaking monoliths into microservices.

4

WEEKS 10–12

Infrastructure as Code

Provisioning with Terraform and configuration management with Ansible.

5

WEEKS 13–14

CI/CD & Observability

GitHub Actions, Jenkins, automated deployment, Prometheus and Grafana.

6

WEEKS 15–16

Capstone: Integrate & Defend

Full system assembly, live demo, architecture defense and interview prep.

Linux, Bash & Git → Cloud Platforms

Phase 1 · Weeks 1-3

Linux, Bash & Git Foundations

- **Week 1 — Linux & the Command Line:** file systems, permissions, process management and everyday shell commands.
- **Week 2 — Bash Scripting & Networking:** writing scripts to automate tasks, plus TCP/IP, SSH and basic firewall concepts.
- **Week 3 — Git & GitHub:** branching workflows, pull requests and code review as part of a delivery pipeline.

Phase 2 · Weeks 4-6

Cloud Platforms: AWS & Azure

You won't just learn one cloud. Cognivara trains you on both AWS and Azure in live projects rather than theory alone, so you're adaptable across enterprise environments.

- AWS core services: EC2, S3, IAM, VPC
- Azure core services: virtual machines, Blob Storage, Active Directory, VNet
- Multi-cloud networking, security groups and cost awareness
- Hands-on: deploy the same workload on both platforms

Containers & Orchestration → Infrastructure as Code

Phase 3 · Weeks 7–9

Containers & Orchestration

- **Week 7 — Docker Fundamentals:** images, containers, Dockerfiles and volumes — package an app once, run it anywhere.
- **Week 8 — Kubernetes Core Concepts:** pods, deployments, services and config maps across a real cluster.
- **Week 9 — Scaling & Microservices:** auto-scaling, rolling updates, and breaking a monolith into independent services.

Phase 4 · Weeks 10–12

Infrastructure as Code

Weeks 10–12 cover Terraform providers, state and modules, Ansible playbooks and roles, and combining both into one repeatable provisioning workflow.

IF YOU NEED TO

USE THIS TOOL

Provision cloud resources declaratively

Terraform

Configure software on existing servers

Ansible

Package an app with its dependencies

Docker

Orchestrate containers at scale

Kubernetes

Automate build, test and deploy

CI/CD pipeline

Automate, Observe & Defend

The final four weeks bring every earlier phase together into one automated, observable, deployed system.

Week 13 — CI/CD Pipelines

GitHub Actions and Jenkins — push code, test, build and deploy with zero manual steps.

Week 14 — Monitoring & Observability

Prometheus for metrics, Grafana dashboards and alerting before users notice.

Week 15 — Integrate

Full system assembly, end-to-end testing, cost and performance review.

Week 16 — Defend

Live demo, architecture defense, interview prep and a portfolio-ready deliverable.

Operating principle: you only automate what you can already do reliably by hand and fully understand. Automation should remove repetitive toil — it should never hide risk you haven't accounted for.

CAPSTONE PROJECT

A real system you'll deploy end to end

Build one cloud-native application — an e-commerce site, a SaaS demo, or an internal tool of your choice — provisioned, containerized, automated and monitored the way a real engineering team would run it.

- Infrastructure provisioned with Terraform, configured with Ansible
- A multi-service app deployed on Kubernetes with auto-scaling
- A full CI/CD pipeline: push → test → build → deploy
- Live Grafana dashboards backed by Prometheus, with alerting rules
- A public GitHub project recruiters can review

How the capstone is evaluated

COMPONENT	WEIGHT
Infrastructure provisioning (Terraform/Ansible)	20%
Containerization & Kubernetes deployment	20%
CI/CD pipeline reliability	15%
Monitoring & observability	15%
Security & access control	10%
Performance & cost optimization	10%
Documentation & presentation	10%

TOOLS & INSTRUCTOR

What you'll work with

Linux

Bash

Git

GitHub

AWS

Azure

Docker

Kubernetes

Terraform

Ansible

Jenkins

GitHub Actions

Prometheus

Grafana

Nginx

Aira — Cloud & DevOps Instructor

Focused on cloud infrastructure, Kubernetes, Infrastructure as Code and CI/CD automation.

- Teaches through real multi-service deployments across AWS and Azure, not isolated tutorials
- Emphasizes operational judgment: what to automate, what to monitor, and why
- Reviews every learner's infrastructure and pipeline design personally

SCHEDULE & INVESTMENT

16 weeks. About 160 live hours. One fee.

16

WEEKS

10

HRS / WEEK

160

TOTAL LIVE HRS

20

MAX COHORT

Fee

₹49,999 one-time

EMI

Not available

Time slot

8:00–10:00 PM IST, Mon–Fri

Cloud budget

Mostly free-tier; ₹1,000–3,000 for overflow

Certificate

Yes, on completing requirements

Placement guarantee

No

We provide career and placement assistance — resume review, GitHub/portfolio review, mock interviews and job-search strategy. This does not constitute a guarantee of employment, salary, company or role.

Frequently asked questions

Q. Do I need prior DevOps experience?

No, but basic computer and command-line comfort helps you keep pace.

Q. Will I work with real cloud accounts?

Yes — hands-on labs use both AWS and Azure, mostly within free-tier limits.

Q. What if I miss a live session?

Recordings are available for enrolled learners for every live session.

Q. Is there a certificate?

Yes, awarded on meeting the program's completion requirements.

Q. Do I need to pay for cloud usage?

Most labs fit within free-tier; budget roughly ₹1,000–3,000 for any overflow.

Q. Are EMI plans available?

Not currently — the program fee is a one-time payment.

Q. Is placement guaranteed?

No. We provide placement assistance, not a guarantee of employment.

Q. Can I use the capstone in my portfolio?

Yes, it's designed as a public GitHub project you can show recruiters.

ENROLLMENT

Ready to build the infrastructure of tomorrow?

Learn with mentors. Build real deployments. Prepare for your next opportunity.

roshansalunke91@gmail.com · [+91 99200 11295](tel:+919920011295) · cognivaraacademy.com

Placement assistance does not constitute a job guarantee. Program fees, schedules, curriculum and access terms are subject to the applicable enrollment terms shared before payment.
